

Light is sustainable

Sustainability in Lighting Goes Beyond the Bulb

Choosing an energy efficient light bulb offers bigger benefits than just the single bulb you purchase.

The OSRAM SYLVANIA commitment to environmental sustainability extends well beyond the bulb. Environmental stewardship is a fundamental part of our business ethic. As a leader in innovative solutions, we are dedicated to products and processes that help solve global sustainability challenges and protect our environment today and in the future.

SYLVANIA Compact Fluorescent (CFL) bulbs save up to 75% in energy costs and LED bulbs save up to 80% in energy costs from standard light bulbs. LEDs have the added benefit of not containing any hazardous materials such as mercury or lead. Their bright white light compliments any home or office. All of these bulbs also last longer than traditional ones and that means fewer purchases for you.

While it's great that energy saving lighting can save you money on monthly electric bills, using less energy also reduces emissions of carbon dioxide, air-borne mercury, and other harmful pollutants because power plants will burn fewer fossil fuels to meet the lower energy demand.

Additionally, long life doesn't just mean you save money on replacements. Long life light bulbs have a much bigger environmental impact. For example, manufacturers use fewer raw materials when they produce fewer bulbs, fewer bulbs are shipped, less packaging is produced which leads to less packaging being recycled and fewer bulbs ending up in landfills.

All of these benefits together lead to us a more sustainable world.
